                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          QΥ
                                                                                                                                                                                                                                                                                                                                                               ;
                                                                                                                                                  This sequence encodes a LM609 grafted antibody variable light chain region. LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3 and can be used to inhibit binding of alphavbeta4 of a ligand and thus block integrin-mediated signal transduction. This is useful in specifically angiogenesis and restenosis of alphavbeta3-mediated disease, specifically angiogenesis and restenosis (but also e.g. (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psorlasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Enhanced types of LM609 have affinity more than 90 times greater than that of parent the parent antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vitaxin; antibody; variable region; heavy chain; light chain; integrin; LM609; inhibitor; integrin-mediated signal transduction; treatment; diagnosis; angiogenesis; restencesis; inflammation; diabetic retinopathy; neovascular glaucoma; cancer; psoriasis; rheumatoid arthritis; murine; macular degeneration; osteoporosis; ss.

Vitaxin and the antibody LM609 bind selectively to integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphavbeta3 mediated disease, specifically angiogenesis and restenosis; (but also e.g. (non-)lmmune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Bhanced types of LM609 have affinity more than 90 times greater than that of parent the parent antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CTTTCCTGCCAGGCCAGCCAAAGTATTAGCAACCACCTACACTGGTATCAACAAAGGCCT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to enhanced LM609 grafted antibodies exhibiting selective binding affinity to alphaVbeta_3 integrin or their functional fragments. The antibodies or their functional fragments can be used in the diagnosis and treatment of alphaVbeta_3-mediated diseases such as angiogenesis, inflammatory diseases (such as psoriasis and chronic articular rheumatism), disorders associated with inappropriate or inopportune invasion of vessels (such as diabetic retinopathy, neovascular glaucoma and cancer disorders such as tumours and Kaposi's sarcoma), retinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 GAGATTGTGCTAACTCAGTCTCCAGCCACCTGTCTCTCAGCCCAGGAGAAGGGCGACT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to enhanced LM609 grafted antibodies exhibiting selective binding affinity to alphaybeta_3 integrin or their functional fragments. The antibodies or their functional fragments can be used in the diagnosis and treatment of alphaybeta_3-mediated diseases such as angiogenesis, inflammatory diseases (such as psoriasis and chronic articular rheumatism), disorders associated with inappropriate or inopportune invasion of cancer disorders such as tumours and Kaposi's sarcoma), retinal diseases (such as macular degeneration), restenosis and diseases (such as macular degeneration), restenosis and

LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3
and can be used to inhibit binding of alphavbeta3 to a ligand and thus
block integrin-mediated signal transduction. This is useful in the
treatment, prevention and diagnosis of alphavbeta3-mediated disease,
specifically angiogenesis and restenosis (but also e.g. (non-)immune
inflammation, diabetic retinopathy, neovascular glaucoma, cancer,
psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis
etc.). The antibodies contain non-murine framework regions so are
suitable for use in humans. Enhanced types of LM609 have affinity more
than 90 times greater than that of parent the parent antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /*tag= a

This DNA sequence codes for a humanised light chain variable region (see AAY32407) of murine monoclonal antibody VTml-1 (MuVTml-1), an antibody that specifically binds to the B subunit of verotoxin II (VT2). The invention relates to humanised autibodies against VT2 that are capable of neutralizing VT2 and/or VT2 variants. The humanised antibody is a humanized form of MuVTml-1 comprissing the complementarity determining regions of MuVTml-1 (see AAY32404-05) and heavy and light chain variable region frameworks from the human GF4 antibody heavy and light chain variable region frameworks from the human GF4 antibody heavy are used from Ld9, H29, H30, H39 and H38 is occupied by the mino acid at the equivalent position of the MuVTml-1 antibody heavy or light chain variable region framework. Such humanized antibodies have an affinity for VT2 that is 3., 5 or 10 times that of MuVTml-1. The toxic effects from VT2 (laimed), especially for treating a patient suffering from, or at risk of, verotoxin producing Escherichia coil (VTBC) infection, and haemolytic
                                                                                                                                                            for treating Verotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

It was prepared from 4 overlapping synthetic oil gonucleotides (see AAV71816-19). The synthetic gene was used to construct an expressi vector for humanised D12 VL. D12 is an anti-alpha-v beta-3 vitronectin receptor MAb. Humanised D12 MAbs can be used for passive immunotherapy of disorders mediated by the alpha-v beta-3 vitronectin receptor, e.g. restenosis and angiogenic associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New anti alpha_v beta_3 vitronectin receptor antibodies - used for immunotherapeutic treatment of e.g. diabetic retinopathy, inflammatory disorders, atherosclerosis, restenosis, cancers or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                The present invention describes a method of producing humanised humanoglobulins involving expressing in a cell a nucleic acid encoding a humanised version of an immunoglobulin. This is sobtained by comparing a donor and human immunoglobulin and producing a combined antibody which contains part of each. These are useful in the treatment of graft-versus-host disease, transplant rejection, autoimmune diseases such as diabetes, rheumatoid arthritis, myasthenia gravis, multiple sclerosis and systemic lupus erythematosus, herpes infections, CMV virus infections and myeloid leukaemia. The present sequence is an antibody cDNA used to

See AAW84004) of the anti-human alpha-v beta-3 vitronectin receptor murine monoclonal antibody D12. It was obtained from hybridoma total RNA by RT-FCK using mouse kappa and N-terminal-based primers (see AAV71808-09). A heavy chain variable region clone (see AAV7197) has also been identified. D12 VH and VL show sequence similarity to Kabat VH subgroup I (see AAW84095) and Kabat VK subgroup III (see AAW84096), respectively. Humanised VH (see AAW84096), respectively. Humanised VH (see AAW84098) were constructed by combining the framework regions of the human V region consensus sequences with complementarity determining regions of D12 (keeping some preferred murine framework residues). The humanised antibodies are specifically reactive with the human seceptor. They can be used for passive immunotherapy of a disorder receptor. They can be used for passive immunotherapy of a disorder disorders or angiogenic-related disorders, such as angiogenesis associated with diabetic retinopathy, atherosclerosis and a such consensus associated with diabetic retinopathy, atherosclerosis and a such consensus associated with diabetic retinopathy, atherosclerosis and a such consensus associated with diabetic retinopathy, atherosclerosis and a such consensus associated with diabetic retinopathy, atherosclerosis and a such consensus associated with diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      loss due to immobilisation or sex hormone deficiency. They can also be used for targeted drug therapy, and for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     restenosis, chronic inflammatory disorders, macular degeneration, rheumatoid arthritis and cancer, e.g. solid tumour metastasis, and diseases where bone resorption is associated with pathology such as osteoporosis, hyperparathyroidism, Paget's disease, hypercalcemia of malignancy, osteolytic lesions produced by bone metastasis, bone

This DNA sequence codes for the light chain variable region (see AXY32465) of murine monoclonal antibody VTml-1 (MuVTml-1), an antibody that specifically binds to the B subunit of verotoxin II (VT2). The invention relates to humanised antibodies against VT2 that are capable of neutralizing VT2 and/or VT2 variants. The humanised antibody is a humanized form of MuVTml-1 comprising the complementarity determining regions of MuVTml-1 and heavy and light chain variable region frameworks from the human GF4 antibody heavy and light chain trameworks. Provided that at least I position selected from L49, H29, H30, H49 and H98 is occupied by the amino acid at the equivalent position of the MuVTml-1 antibody heavy or light chain variable region framework. Such humanized antibodies (see AXY32406-07) have an affinity for VT2 that is 3-, 5 or 10-times frut of MuVTml-1. They are used for treating a patient suffering from, or at risk of, the toxic effects from a patient suffering cfor treating verotoxin producing Escherichia coli (VTEC) infection, and haemolytic uraemic syndrome (HUS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Humanized antibody binding to verotoxin II used for treating Verotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vasques

AAA AAA4326 to AAAA5925 represent specifically claimed secreted expressed sequence tags (sESTs), isolated from human, mouse, chicken and rat tissue sources. The SESTs can have a range of activities depending on the tissues they were isolated from. The activities include: chemotactic; proliferative; immunomodulatory; haematopoietic: chemotactic; proliferative; immunomodulatory; haematopoietic: chemotactic; analgesic; haemacstatic; thrombolytic; antidiabatic; corpostatic; antibacterial; antifundal; antiviral; antidiabatic; antidathmatic; vulnerary; antidice; osteopathic; neuroprotective; corportoric antiparkinsonian; antipsoriantic; cerebroprotective; anticonvulsant; and antidepressant. The sESTs can be used for gene therapy and in vaccines. The sESTs are useful as probes for the identification and isolation of full-length colons and genomic DNA condecules which correspond to the sESTs. Proteins encoded by the sESTs are useful in assays for determining biological activity and raising antibodies. They may be useful for treatment of autoimmune disorders (multiple sclerosis, insulin dependent diabetes), allergic conditions of setoporosis, osteoarthritis, central nervous system disorders (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (Cohn's parkinson's, Huntington's disease, stroke), coagulation disease), tumours, bacterial, fungal or viral infections, depression and soriasis. AAA45926 to AAA45921 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó;
